**Navigating AX (AI Transformation):
Preserve the Best, Re-Invent the Rest**

2. 발표 요약문 (500자 이상)

영문 요약문

As a graduate student at MIT, I studied Neural Networking, recognizing its enormous potential despite my business background.

Fast forward, and AI is everywhere, dominating boardrooms, media, and regulatory discussions. Industries, including Human Resources, are racing to adopt AI for hiring, training, and managing employees.

While AI promises to streamline processes and boost productivity, it also raises ethical concerns about privacy, human rights, and decision-making.

Despite calls to slow AI development, investment and innovation are accelerating. Leaders must approach AI with humility, acknowledging unknown risks, and collaborate across sectors to address its perils—like misinformation, deepfakes, and the erosion of trust.

The future will depend on cultivating global talent capable of navigating AI's challenges, especially in HR, where AI's role in managing people must be handled with care.

Asking the right questions and fostering a collaborative, thoughtful approach will be crucial for managing AI responsibly and ethically.
